

## COMP114 WEBSITE PROJECT

Using your own webpage template, you are to create a personal website about yourself using HTML.

### Instructions

- Create a header by inserting a banner of your choice
- In the navigation bar include the following menus
  - Homepage
  - About me
  - Education
  - Future Career
  - New user
  - Search
  - Contact me

There should be a short paragraph about you, insert pictures wherever possible to enhance your page.

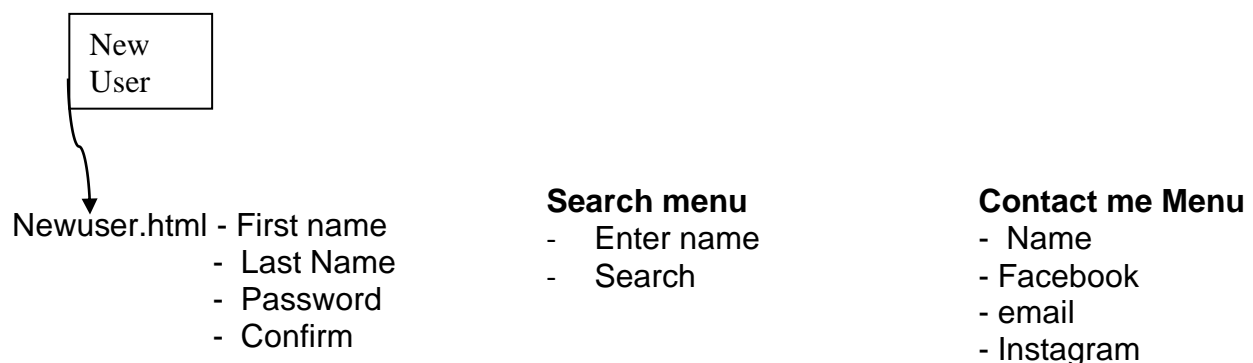

The links to the above menus should take you to a new page. For example the Education menu should take you to Education.html page that would include information about Primary, Secondary, Tertiary, Short course taken or any certification program you may have completed. Future career should take you to the page career.html and should give information on your future career/profession and why you decided to pursue such a career. All the pages must have the same basic layout.

New User should take you to Newuser.html and should include the following:

Username

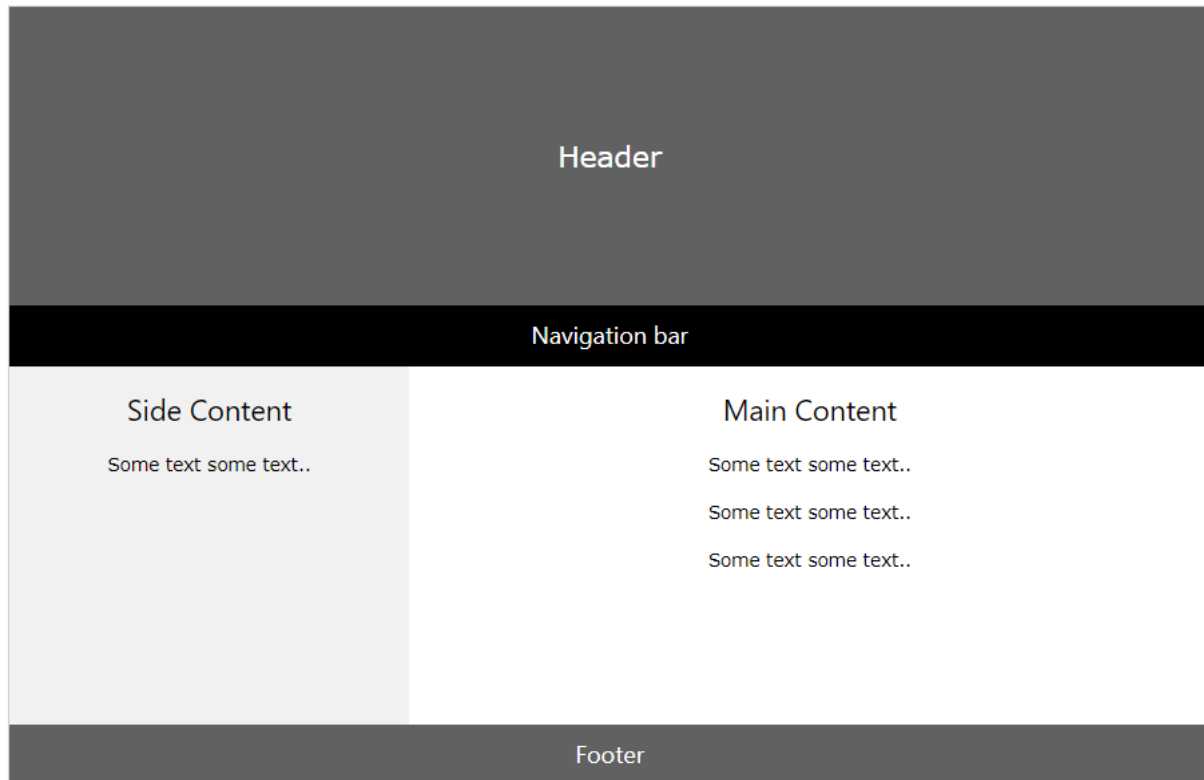

Password

} Should be validated using Java Script

## A "Layout Draft"

It can be wise to draw a layout draft of the page design before creating your website:

## Creating Page Content

Inside the `<body>` element of our website, we will use our "Layout Draft" and create:

- A header
- A navigation bar
- Main content
- Side content
- A footer

### Header

A header is usually located at the top of the website (or right below a top navigation menu). It often contains a logo or the website name: You will use CSS to style the header.

## **Navigation Bar**

A navigation bar contains a list of links to help visitors navigating through your website: You will use CSS to style the navigation bar.

## **Content**

Create a 2-column layout, divided into a "side content" and a "main content". You will use CSS to handle the layout.

## **Footer**

At last, we will add a footer and style it using CSS.
